Claim 2; Page 403; 543pp; English.

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated real prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and of cancer in a patient. (I) and cancer in a patient. (I) are used for the used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate

The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polymucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polymucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The prostate specific peptide of the invention. The peptides either represent
                                                                                                 ..
                                                                                                                                                                                                                                                                                             Human; prostate cancer; ss; cytostatic; immunostimulant; tumour; antigen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human prostate-specific polypeptides and polynucleotides useful for the diagnosis and treatment of cancer, especially prostate cancer.
      volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polymiclectide and amino acid sequences used in the exemplification of the present invention
                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kalos MD;

The present invention describes an isolated polypeptide (P1) comprising at least an immunogenic portion of a prostate-specific protein, or its variant. Also described are polynucleotides (N1) encoding (P1). (P1) and (N1) have cytostatic activity and can be used in vaccine production. The polypeptides, nucleic acids and antibodies from the present invention are useful in the diagnosis and therapy of prostate cancer. Prostate specific genes P704P, P774P, P775P and B305D are located in a genomic Prostate specific antigen (P8A) P50LS was located on chromosome 1.

AAH884671 to AAH85143 and AAG99000 to AAG99077 represent polynucleotide and polypeptide sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This is the amino acid sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Prostate specific protein and its encoding polynucleotide, useful for the treatment and diagnosis of prostate cancer.
                                                                                                                                                                                                 Prostate cancer; vaccine; gene therapy; cytostatic; fusion protein; immunogen; cancer; prostate specific antigen; PSA; prostatic acid phosphatase; PAP; prostate specific membrane antigen; PSMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Kalos MD;

```
The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; prostate specific cDNA; cytostatic; immunostimulant; gene therapy; cell therapy; vectine; T-cell epitope; class I major histocompatibility complex allele; MHC; prostate cancer; tumour; antigen presenting cell; epitope.

The invention relates to an isolated polypeptide comprising no more than 1-542 amino acids of ADB11553 comprising a sequence ADB14617. The peptides comprise a fragment ADB1353 of that contain naturally processed T-cell epitoppes for 3 class I major histocompatibility complex (MHC) and 1-642 amino acids of ADB11553 is a polypeptide encoded by a human prostate specific CDNA, one of 648 disclosed as new Also included are nucleic acids necoding the proteins and peptides, expression vectors, a host cell cDNA, one of 648 disclosed as new Also included are nucleic acids composing the protein or peptide, detecting the presence of a cancer in a patient (comprising contacting a patient camprising contacting a patient camprising contacting a patient camprising or contacting a patient comprising to contacting a patient camprising the peptides or proteins, stimulating or expanding T cells appetite or the agent and comparing the amount of polypeptide that binds to the agent and comparing the amount of polypeptide that binds to the agent and comparing the amount of polypeptide to a predetermined correct appearing as ADB1359, detecting the amount of polypeptide to a predetermined correct of a author protein comprising contacting T cells specific for a tumour protein comprising contacting the predetermined comprising determined to repetides or the isolated T cell population, treating prostate cancer in a patient and treating prostate cancer in a patient comprising contacting cluster of differentiation (CD4+) and/or CD8+ T cells the protein comprising the presenting cluster of differentiation (CD4+) and/or CD8+ T cells the protein contacting cluster of differentiation (CD4+) and/or CD8+ T cells specific for antigen-presenting cells expressing the nucleic acid, are used to encode the protein and present esquence is an epitope or estimulate or expand T cells specific for a unmour protein. The peptides or treat cancer in a patient. The present esquence is an epitope or peptide derived from one of the prostate specific proteins of t

The invention relates to human prostate-specific polypeptides and the polymucleotides encoding them. The invention also relates to an isolated antibody or its antigen-binding fragment that specifically binds a polypeptide of the invention, a method of detecting cancer in a patient comprising contacting a biological sample of the patient with an agent that binds a prostate-specific polypeptide and comparing the amount of bound polypeptide compared to a prodetermined cut-off value and a fusion protein comprising a prostate-specific polypeptide. The sequences of the invention are used to diagnose and treat cancer, particularly prostate cancer. This sequence represents a human prostate-specific polypeptide of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotides encoding prostate specific polypeptides isolated from a human prostate tumor cDNA library are useful to diagnose and treat cancer particularly prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ×
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Henderson RA;

```
human secreted proteins expressed in prostate, and encode the proteins purent secreted proteins expressed in prostate, and encode the proteins given in AAY11716 to AAY11993 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The roducts are also be used for producing secreted human gene nucleic acid sequences can be used for producing secreted human gene therapy. The proteins obtained may have cytokine activity, cell proliferation and differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequences. The nucleic acids encoding the signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell

New isolated human secreted proteins.

```
This sequence is encoded by an extended human secreted protein coding sequence of the invention. The secreted proteins can be used in treating or controlling a variety of human conditions. The secreted proteins may act as cytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, haematopoiesis regulators, tissue growth regulators, regulators of reproductive hormones or cell movement or have chemotactic/chemokinetic, receptor/ligand, anti-inflammatory or tumour inhibition activity. The DNAs can be used in forensic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to identify the genes corresponding to the extended cDNAs. They are also useful for constructing a high resolution map of the human chromosomes. They can also be used for gene therapy to control or treat genetic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

New human receptors and membrane-associated proteins (REMAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant REMAP expression e.g. cancer, AIDS, atherosclerosis, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated polypeptide comprising a human receptor and membrane-associated protein (REMAP). The polypeptide of the invention demonstrates cytostatic, antiarteriosclerotic, anticonvulsant, nootropic, neuroprotective, cerebroprotective, anti-HIV, antiallergic, antinflammatory and thyromimetic activities and may be useful for treating and disponsing various disorders including those which are cell proliferative such as cancer and atherosclerosis, neurological including epilepsy, Huntington's disease and stroke, immune/inflammatory particularly AIDS and allergies and developmental such as hypothyroidism and Cushing's syndrome, as well as infections. The current sequence is that of the human REMAP protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                Duggan BM, Yang J, Gietzen KJ, Lee SY, Tang YT, Azimzai Y;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human cDNA sequences that encode human secreted proteins. The invention also relates to an antibody that specifically binds to a polypeptide of the invention and a method of binding the polypeptide to an antibody. The polymucleotides are useful for expressing the entire secreted proteins which they encode and for distinguishing human tissues and cells, and for distinguishing between human tissues and cells, and for distinguishing between human tissues and cells, and for colypeptides are useful in forensic procedures or disquestive individuals with genetic diseases resulting from abnormal expression of the genes corresponding to the cDNAs. The sequences are also useful in gene therapy to control or treat genetic diseases are sequence are human secreted polypeptide of the invention. Note: The sequence data for this patent did not form part of the printed specification but, was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide encoding secreted polypeptide, useful for gene therapy, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal expression of the genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human; receptor and membrane-associated protein; REMAP; cytostatic; antiatteriosclerotic; anticonvulsant; nootropic; neuroprotective; cerebroprotective; anti-HIV; antiallergic; antinflammatory; thyromimetic; cell proliferative; cancer; atherosclerosis; neurological;

The invention relates to novel isolated nucleic acid molecules and polypeptides present in normal and neoplastic ovarian cells. These comprise a nucleic acid sequence encoding any of the 167 amino acid sequences (c.g. 438, 237 or 233 amino acids) fully defined in the comprise a nucleic acid sequence encoding any of the 167 amino acid sequences (c.g. 438, 217 or 233 amino acids) fully defined in the specification (SEQ. ID NOs: ADP81055 to ADP81054) and comprises any of the 128 nuclecide sequences (c.g. 4798, 1494 or 1691 bp) fully defined in the specification (SEQ. ID NOs: ADP80957 to ADP81094). The invention further comprises: a method for determining the presence of a ovarian specific nucleic acid (OSNA) in a sample; a vector comprising the above nucleic acid molecule; a polypeptide encoded by the nucleic acid molecule cited above; an antibody continued for determining the above nucleic acid molecule; a polypeptide encoded by the nucleic acid molecule cited above; an antibody continued for determining the presence of an ovarian specific protein in a sample; a method for diagnosing or monitoring the presence of cancer in a patient, the kit comprising a means for conformation the presence of the above nucleic acid molecule or conforming the presence of the above nucleic acid molecule or conforming the presence of the above nucleic acid molecule or conforming the presence of the above nucleic acid molecule or cycostatic activity. The isolated nucleic acid molecules and polypeptides have conformed nucleic acid molecules and polypeptides have conformed the acid molecules and polypeptides have conformed ancer; and method of for acid molecules and polypeptides can be used to create a vaccine. The isolated nucleic acid molecules and polypeptides can be used for all and an expense and method of conforming and molecules and polypeptides and polypeptides and method of conforming and method of confo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer and treating ovarian cancer. This sequence represents the protein of an ovarian specific gene of the invention.

New nucleic acids, and encoded proteins, from prostatic cancer tissue, useful for diagnosis, treatment and in screening for specific binding agents.

Claim 2; Page 585; 1607pp; German.

This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection broatestic tissue. Screening for inhibitors of the sequences or detection or opinionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of twour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular weight below 5000, preferably 300, that binds to the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; a (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polypuncleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, between normal and tumorous fisques, with (over) expression analysis, using by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated sequentially with anti-human CD4 murine monoclonal antibodies; biotinylated second antibody, streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained strongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65805-ADR66584 represent the polynucleotide and polypeptide sequences used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 114, Application US/09159812A

Patent No. 6613872

GRERAL INFORMATION:
APPLICANT: NJ. Jiangchun
TITLE OF INVENTION: COMPOUNDS FOR IMMUNOTHERAPY OF
TITLE OF INVENTION: COMPOUNDS FOR IMMUNOTHERAPY OF
TITLE OF INVENTION: TOOSTATE CANCER AND METHODS FOR THEIR USE
FILE REFERENCE: 210121.428C5
CURRENT PILING DATE: 1998-09-23
NUMBER OF SEQ ID NOS: 306
SOFTWARE: PastSEQ for Windows Version 3.0
SEQ ID NO 114
LENGTH: 241

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Photosystem II oxygen-evolving complex protein 2 precursor - spinach
NiAlternate names: water-splitting complex extrinsic membrane protein 23K chain
C;Species: Spinacia oleracea (spinach)
C;Accession: So0005; S03272
R;Jansen, T; Rother, C.; Steppuhn, J.; Reinke, H.; Beyreuther, K.; Jansson, C.; Anderssc
FEBS Lett. 216, 234-240, 1987
A;Title: Nucleotide sequence of cDNA clones encoding the complete '23 kDa' and '16 kDa' k
A;Reference number: S00005
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A;Accession: S00005

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Genetic divergence at the SODA locus of six different formae "Genetic divergence at the SODA locus of six different formae speciales of Pheumocystis carini:";
Med. Mycol. 38:289-300(2000).
-!- FUNCHION: Destroys radicals which are normally produced within the cells and which are toxic to biological systems (By similarity).
-!- CATALYMIC ACTIVITY: 2 superoxide + 2 H(+) = O(2) + H(2)O(2).
-!- SIMILARITY: Belongs to the iron/manganese superoxide dismutase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota; Fungi; Ascomycota; Pneumocystidomycetes; Pneumocystidaceae;

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated r cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is paticularly prostate cancer. The and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and of the prostate cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides for antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The prostate specific peptide of the invention. The peptides either represent

The present invention describes an isolated polypeptide (P1) comprising at least an immunogenic portion of a prostate-specific protein, or its variant. Also described are polymucleotides (N1) encoding (P1). (P1) and (N1) have eytostatic activity and can be used in vaccine production. The polypeptides, nucleic acids and antibodies from the present invention are useful in the diagnosis and therapy of prostate ancer. Prostate specific genes PPO44, P712P, P775P and B305D are located in a genomic region on chromosome 2241.2 known as the Cat Eye Syndrome region. Prostate specific antigen (PSA) P501S was located on chromosome 1. ARR84671 to AAR85143 and AAG99000 to AAG99077 represent polynucleit invention invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This is the amino acid sequence of a

                        The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences. The PSPs and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human prostate protein P503S epitope mapping peptide #2101.

The invention relates to an isolated polypeptide comprising no more than 11-542 amino acids of ADB1353 comprising a sequence ADB1487. The peptides comprise a fragment ADB1363 of that contain naturally processed T-611-542 amino acids of ADB14853 comprising a sequence ADB1487. The peptides comprise of a fragment ADB1353 of that contain naturally processed T-611-616 and ADB14853 is a polypeptide encoded by a human prostate specific cDNA, one of 648 disclosed as new Also included are nucleic acids corcoling the proceins and peptides, expression vectors, a host cell transformed with the vector, an isolated antibody (or antigen binding fragment) that specifically binds to the procein or peptide, detecting ample with a binding agent that binds to the procein or peptide, detecting ample with a binding agent that binds to the peptides or a polypeptide to appearing as ADB1358, detecting the amount of polypeptide that binds to the agent and comparing the amount of polypeptide that binds to the apeptides or a tumour protein comprising the predetermined cut-off value to determine the presence of cancer; a tumour protein comprising T cells with the specific for a tumour protein comprising contacting T cells specific for a tumour protein comprising the presence of a cancer in a patient and treating prostate cancer in a patient acids, antibodies or compounds, determining the presence of a cancer in a patient of differentiation (CD4+) and/or CD8+ T cells isolated to combating cluster of differentiation (CD4+) and/or CD8+ T cells the profiles or antigen presenting cells expressing the nucleic acid, are used to estimilate or expanding the protein contact acids encoding the contact acids, antibodies, fusion proteins. The peptides or treat contact in a patient. The peptides or treat contact in a patient. The present esquence is an epitope or estimilate or expand T cells specific for a unmour protein. The peptides cancer in a patient. The present esquence is an epitope or presenting cells are used to stimulate an immune response or 
                                                                                                                                          New isolated polypeptide for use in a vaccine for stimulating an in response, or for treating or diagnosis cancer, preferably prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     segdata.uspto.gov/seguence.html?DocID=20030185830

New polynucleotides encoding prostate specific polypeptides isolated from a human prostate tumor cDNA library are useful to diagnose and treat cancer particularly prostate cancer.

# Example 18; SEQ ID NO 504; 99pp; English.

The invention relates to human prostate-specific polypeptides and the polynucleotides encoding them. The invention also relates to an isolated antibody or its antigen-binding fragment that specifically binds a polypeptide of the invention, a method of detecting cancer in a patient comprising contacting a biological sample of the patient with an agent that binds a prostate-specific polypeptide and comparing the amount of bound polypeptide comparted to a predetermined cut-off value and a fusion protein comprising a prostate-specific polypeptide. The sequences of the invention are used to diagnose and treat cancer, particularly prostate cancer. This sequence represents a human prostate-specific polypeptide of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequence.html.

New human receptors and membrane-associated proteins (REMAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant REMAP expression e.g. cancer, AIDS, atherosclerosis, or infections.

claim 1; SEQ ID NO 19; 298pp; English.

The invention relates to a novel isolated polypeptide comprising a human receptor and membrane-associated protein (REMAP). The polypeptide of the invention demonstrates extostatic, antiatrefisocialerotic, antiatornulsant, nootropic, neuroprotective, cerebroprotective, anti-HIV, antiallergic, antiinflammatory and thyromimetic activities and may be useful for treating and diagnosing various disorders including those which are cell proliferative such as cancer and atherosclerosis, neurological including epilepsy, Huntington's disease and stroke, immune/inflammatory particularly AIDS and allergies and developmental such as hypothyroidism and Cushing's syndrome, as well as infections. The current sequence is that of the human REMAP protein of the invention.

Claim 12; SEQ ID NO 157; 754pp; English

The invention relates to novel isolated nucleic acid molecules and copypeptides present in normal and neoplastic ovarian cells. These comprise a mucleic acid sequence encoding any of the 167 amino acid sequences (e.g. 438, 237 or 233 amino acids) fully defined in the captences (e.g. 438, 237 or 233 amino acids) fully defined in the captences (e.g. 438, 1894 or 1691 bp) fully defined in the specification (SEQ. ID NOS: ADP81055 to ADP81094). The invention that the precification (SEQ. ID NOS: ADP80967 to ADP81094). The invention further comprises: a method for determining the presence of a ovarian specific acid molecule; a host cell comprising the vector comprising the above nucleic acid molecule; a host cell comprising the vector comprising the above polypeptide encoded by the anucleic acid molecule; a producing a polypeptide encoded by the above mucleic acid molecule; a continuing the presence of an ovarian specific protein in a polypeptide encoded by the above polypeptide; a method for diagnosing or monitoring the presence and metastases of or ovarian cancer in a patient, the kit comprising a means for context and a patient, the kit comprising a means for context or polypeptide; a method of treating a patient with ovarian cancer; and a patient with ovarian cancer; and a context of the above polypeptides may be used to create a cytostatic activity. The isolated pulpeptides may be used to create a cytostatic activity. The isolated polypeptides may be used to create a cytostatic activity. The isolated polypeptides may be used to create a context and treating ovarian cancer. This sequence represents the protein concer and treating ovarian cancer. This sequence represents the protein concer and preating or monitoring the presence of the invention.

Sequence 174 AA;

```
This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer. Or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, can short-interfering RNA or riboxymes; an organic molecula of molecular weight below 5000, preferably 300, that binds to the polypeptide; an aptamer against the polypeptide; a (monoclonal) antibody (ab) against the polypeptide, and anti-idiotype, non-human (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polynucleotides are identified in human prostatic cancer by differential expression analysing waing Namicroalrays, hearted

sequentially with anti-human CD4 murine monoclonal antibodies; biotinylated second antibody; streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown): The samples were countersteained with hemalum (blue). Malignant cells stained strongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarchoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR6505-ADR66954 represent the polymucleotide and polypeptide sequences used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Specht T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acids, and encoded proteins, from prostatic cancer tissue, useful for diagnosis, treatment and in screening for specific binding

    weight below 5000, preferably 300, that binds to the polypeptide; an aptamer against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide, preferably humanised or human; an anti-idiotype, non-human comparison antibody antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polymuclectides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated prostatic cancer patients, or subjects at risk, were incubated sequentially with anti-human CD4 murine monoclonal antibodies; bictinylated second antibody; streptavidin-conjugated horseradish central antibodis antibody; streptavidin-conjugated horseradish centrally but non-malignant cells only weakly. In 15 of 61 samples of atrongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metaatases were also stained. ADR66954 represent the invalidation of the invalidation of

    Clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAV34145) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 70 novel genes and their fragments (nucleic acid sequences: AAV34154-V34276, amino acid sequences AAM75057-W75179) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotideds. Specific uses are described for each of the 70 polynucleotides, based on which tissues they are most highly expressed in (see AAV34154 for described uses). (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct

Novel isolated human secreted HODAZ50 polypeptide useful for diagnosing or treating deficiencies or disorders of the immune system, autoimmune disorders, hyperproliferative disorders, and infectious diseases.

Claim 11; Page 173; 243pp; English.

The invention describes an isolated human secreted HODAZ50 polypeptide (I) comprising a sequence at least 95% identical to a sequence selected from polypeptide fragment of any one of the 123 polypeptide sequences

```
cc (PS) fully defined in the specification and having biological activity, polypeptide domain or epitope of PS, secreted form of PS, full-length polypeptide domain or epitope of PS, secreted form of PS, full-length protein of PS, or variant, allalic variant or species homologue of PS.

(I) or a polymuclectide (II) encoding (I) is useful for preventing, or ameliorating a medical condition in a mammalian subject. (I) consists of all properties or disposition in a subject. (I) is useful for identifying a binding partner which involves contacting the partner which involves contacting the partner which involves contacting the partner affects the activity of the polypeptide. (I) or (II) is useful for disposing or treating deficiencies or disorders of the immune of partner affects the activity of the polypeptide. (I) or (II) is useful for disposing or treating deficiencies or disorders, atxia telangictasia, HIV infection, wiskott-Addrich disorders, thrombocytopenia or heamoglobinuria, blood wiskott-Addrich disorders, blood platelet disorders, autoimmune disorders of addison's disease, haemolytic ansemia, rheumatoid arthritis, cardinal, addison's disease, haemolytic ansemia, rheumatoid arthritis, cardinal, deficient is glomerulomephritis, Grave, a disease), allergic reactions, cartering upone, breast, disease, allergic reactions, cartering allenges, hyperpoliferative disorders and the abdomen, bone, breast, disease, allergic reactions, corted in the abdomen, bone, breast, disease, and traum or stroke), to system diseases (e.g., spinal cord disorders, head trauma or stroke), to system disease to repair, replace or protect tissue damaged by congential or parasitic replace or protect tissue damaged by congential or defects, trauma (wounds, burns, incisions, or ulcers) age disease (e.g., spinal cord disorders) age disease (e.g., spinal cord disorders) age disease (e.g., spinal cord disorders) are defected traum or stroke the mammal section or augedy to or defected, trauma (wounds, burns, infections, or ulcers) are or decre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           à
```

The present invention describes compositions comprising peptides derived from the Wilm's tumour protein WT1 and methods for their use in treating malignant diseases. Peptides derived from both the murine and human WT1 proteins are provided. The human WT1 gene is found on chromosome 11p13, and the protein was shown to be a zinc finger transcription factor. The immunogenic peptides of the invention are particularly useful in the diagnosis and treatment of cancer and leukaemia. The present sequence is a polypeptide described in the exemplification of the invention Polypeptide comprising part of the Wilms Tumor gene product sequence is used in the diagnosis and treatment of malignant diseases e.g. leukemia and cancer associated with WTI.
